HEAT STRESS

Hazardous heat exposure can occur indoors or outdoors and during any season, putting millions of workers at risk for heat stress. Heat stress is preventable, but every year thousands still become sick, and some cases are fatal. OSHA launched a National Emphasis Program in April, 2022, to bring awareness to this hazard and encourage employers to provide proper procedures, practices, and personal protective equipment.

Heat stress occurs when the body cannot effectively cool down, causing the internal body temperature to rise, which can lead to illnesses such as heat exhaustion or heat stroke.

It's crucial to incorporate heat stress prevention in safety programs because it not only threatens the immediate health of the workers, but it can also impact productivity on the jobsite.

To prevent heat stress, workers should ensure they are allowing their body to gradually adjust to the heat, also called, "acclimatizing." They should also stay hydrated, take breaks in shaded areas, wear suitable clothing, and use cooling measures and personal protective equipment (PPE).

Prioritizing these measures helps ensure a safer and more efficient work environment.

Heat illness treatment focuses on **rapidly cooling** the body's internal temperature.

Nearly **3 out of 4** heat illness fatalities happen during the first week of work.*

Heat-related **fatal injuries** increased by **77%** between 2012 to 2023**
